SUMMARY

Full-stack developer specializing in FastAPI and Node.js backends with production React frontends. Built and maintained features across a field sales automation platform and a multi-tenant LMS, from architecting DB isolation across 5 client orgs to catching same-day critical bugs in production. Strongest at debugging across systems and shipping end-to-end under real constraints.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, SQL

Frontend: React, Next.js, Tailwind CSS, TanStack Query/Table

Backend: FastAPI, Node.js, Express, REST APIs, PostgreSQL

Cloud/DevOps: AWS (EC2, Lambda, S3, ECR, Amplify, CloudTrail), GCP, Docker, CI/CD

EXPERIENCE

Junior Software Developer, EduvanceAI

Aug 2025 – Present

Sales Copilot - Field Sales Automation Platform, HR Johnson

- Built an Excel validation engine for schedule uploads that diffs incoming data against existing records and flags unintended changes to historical entries, with cell-level error annotations
- Built server-side pagination for a 130K+ record dataset using TanStack Table + Query, serving 6.4 KB / ~190ms per page request
- Built 8 admin data-management pages end-to-end (frontend to backend), designing reusable table, modal, and edit-form primitives that reduced files-per-page by ~60% and became the standard pattern across the module
- Fixed an auth token bug that was logging out all active users, tracing it through session logs and patching it the same day
- Integrated a structured logging pipeline across all API endpoints (user, role, visit date, dealer context) and built a logs export feature with IST-converted timestamps, replacing a broken legacy export where IDs were rendering in scientific notation
- Built a persona-aware Order Collection Pitch module in React for 5 dealer personas, integrating recommendation and talking-point APIs, client-side caching, subcategory filtering, and responsive desktop/mobile rendering across multi-tab product journeys

Learning Management System

- Architected multi-tenant database isolation across 5 client organizations: provisioned 5 PostgreSQL databases, migrated schemas, and built a reusable routing hook propagating org-headers across 35+ frontend files
- Caught a critical bug routing all new chatbots to the default DB instead of tenant-specific ones, root-caused it the same day and restored access to one client org's data
- Found and patched a security vulnerability that was leaking deletion authorization codes in API responses, documented the root cause and pushed the fix within hours
- Built the Admin Report from scratch, replacing a static template with a dynamic engine that auto-generates across all chatbots in a course. Now used by leadership for training evaluation and assessment decisions.
- Optimized admin reporting SQL with CTEs and refactored scoring logic (attempts, completion rate, null handling), reducing query execution time by ~35%

Multilingual Chatbot Pipeline

- Built the Hindi chatbot pipeline end-to-end (language selection in creation form, dedicated Hindi processing path, dynamic Hindi prompt generation) with zero regressions to the English flow

- Rewrote 6 APIs broken by the new flow, fixed a scoring logic bug that was crashing chatbots mid-conversation, and added step-level logging for production debugging

Interview Chatbot (Solo Build)

- Solo-built a Project Engineer Interview Chatbot in under 2 weeks (React on Vercel, Python on GCP Cloud Run) with LLM-based response scoring, single-attempt enforcement, and per-question score breakdown. Deployed and demoed to stakeholders from McKinsey.

Web Developer Intern, Rabs Net Solutions Pvt Ltd

Apr 2025 – Aug 2025

- Contributed to production CRM development: built REST APIs with Node.js/Express and resolved client-reported bugs across active deployments

EDUCATION

M.Sc. Information Technology, Sathaye College

2022 – 2024

B.Sc. Information Technology, Raheja College of Arts and Commerce

2019 – 2022
